Orders placed on the retail stores that dropship your products are synced back to your store. You can ship like any other order. On the retailer side, we can automatically import orders from Shopify, WooCommerce, Magento, and BigCommerce. We can also open an API to import from other custom channels if needed.

These retailer dropship orders can be synced to a number of systems, including Shopify and BigCommerce. Or directly within your inventory management or shipping platform.

To get started, dropship retailers simply install Onport, publish, or connect your products, and orders will start to sync automatically.
